Background

I am Andrea Di Capua, an Italian geologist with a PhD in Clastic Sedimentology and a MSc in Sedimentology and Structural Geology, earned at the University of Milan - Bicocca. I investigate the role of volcanism in ancient sedimentary records both in marine and non-marine settings, with a particular focus on the comparison between volcanically-controlled and tectono-climatically controlled sediment supply. I am a gipsy geologist who loves to spend time in the field. From the Alps to the Patagonia desert, I am always on the trail of ancient volcanism in the obscure pages of the sedimentary record. Although I might be in the field, feel free to contact me and wait: someday I will be back and answer you.
